AI Career Copilot

The program that opens today. 21 October 2026.

What it is

This is a local page on this computer. It reads one CV, names the kinds of work that experience supports, searches for jobs that are still open, and shows how each job matches. The person reviews every file and sends the application. The program does not apply.

The brain is the grok program already signed in on this computer. The page does not call https://api.x.ai and it does not use an API key. It cannot read the weekly quota, so it does not enforce a spending cap.

How to open it

From the project folder, after grok login has been done on this computer:

.\.venv\Scripts\career-copilot.exe ui

Open http://127.0.0.1:8501. Stop the command to close the page. Do not set XAI_API_KEY.

What is built

1. User

The person uploads one CV, a DOCX or a single-column text PDF. A scanned page or a multi-column file is refused in one sentence. Read the CV asks grok for up to eight roles and up to twelve skill names. A skill is kept only when that name appears in the CV. The person keeps roles, removes roles, or types one. Save writes the roles. Continue opens Search.

2. Search

No question is required. A blank field is not a preference and adds nothing to a search. Experience level, employment type, and workplace each accept more than one choice. Country, city, and languages are shown. No country means worldwide. Other notes is an optional box. Those lines guide the search and the match. They do not remove a job by themselves. Save writes the choices. Continue opens Jobs.

3. Jobs

Opening Jobs does not search. Automatic search asks grok to look on the public web. The call may use up to eight turns. The whole search stops at 4 minutes. The query is the saved roles, the saved skills, and the Search fields that are filled. The CV is used only to mark how each requirement compares. It is not put into the web query, and it is not stored in the job list.

Python opens each https link again. It drops LinkedIn, private addresses, dead pages, and login walls. A page that says applications are closed, or whose deadline has passed, is left out. A date such as 15 Nov '26 counts, including when it is on the line after Deadline. If no deadline is found, the job stays and Notes says so. A job is kept only when the posting shares at least one skill or role written in the CV. Scoring stops when three jobs reach 50 percent, or when the 4 minutes end.

The table keeps Title, Company, Found at, and Match. It shows at most three jobs at 50 percent or above. If every scored job is under 50 percent, the table shows the single highest match and, under the table: Nada foi encontrado, então retornamos a vaga com o maior match com o seu CV. If no page was opened, the line is only: Nada foi encontrado.

Opening a row shows a header and a cleaned posting, not the raw page. The header has the company, the place, the workplace, the deadline when one was read, and the link. The posting keeps section names and bullets. Then the row shows Match, What matches, Possible matches, What is missing, Notes, and Documents. Python sets the percent. A full match counts 1, a half match counts 0.5, and a gap counts 0. Possible matches are the uncertain lines. Yes moves that line into What matches now and saves a strength. No moves it into What is missing now and saves a gap. The percent is recalculated then. The same answer is

used on the next search. A line with no answer stays under Possible matches and is not saved. The CV text stays unchanged.

The profile card on Jobs lists those strengths and gaps. A saved line can be switched or cleared, and the open job updates with it. Keep this job, beside the title, keeps the job. Remove this job drops that link from a later search.

Saved on this computer

- roles.json stores the chosen roles.
- skills.json stores the skill names.
- search.json stores the filters and the other notes. It does not store the CV.
- cv.txt stores the CV text. jobs.json does not copy it.
- jobs.json stores the latest matches, the jobs the person kept, and the links that were removed.
- traits.json stores each possible match the person accepted or refused. The profile card shows that file as strengths and gaps.

Still to do

The Jobs page names the documents a posting asks for. It does not write them. That is the next phase.

- Generate CV for this job writes an Amsterdam PDF: A4, one column, no photo. Only the summary and Technical Skills may change, and only with facts already in the CV.
- Notes beside the CV file name can ask for a change to the summary or the skills. A locked section stays as it is.
- Generate cover letter for this job appears only when the posting asks for a cover letter or a letter of motivation.
- A portfolio, a transcript, a writing sample, a certificate, or an ID is named only when the posting names it. The person brings that file.
- The program does not submit the application.

What it does not do

- It does not submit an application.
- It does not invent a job, a company, or a link.
- It does not invent an employer, a title, a date, a number, or a skill.
- It does not treat a missing deadline as a closed job.
- It does not put a public website, accounts, or hosted storage in front of the CV.
